*Capybara* José Roberto Moreira,Katia Maria P.M.B. Ferraz,Emilio A. Herrera,David W. Macdonald,2012-08-16 The capybara is the neotropical mammal with the highest potential for production

and domestication. Amongst the favorable characteristics for domestication we can list its high prolificacy, rapid growth rate, a herbivorous diet, social behavior and relative tameness. The genus (with only two species) is found from the Panama Canal to the north of Argentina on the east of the Andes. Chile is the only country in South America where the capybara is not found. The species is eaten all over its range, especially by poor, rural and traditional communities engaged in subsistence hunting. On the other hand, in large urban settlements wildlife is consumed by city dwellers as a delicacy. The sustainable management of capybara in the wild has been adopted by some South American countries, while others have encouraged capybara rearing in captivity.

**Uromastyx** Sareen Telsa,2019-12-29 Uromastyx is remarkable lizards, who inhabit some of the harshest environments on the planet. **The Photo Ark** Joel Sartore,2017 This book of photography represents National Geographic's Photo Ark, a major cross-platform initiative and lifelong project by photographer Joel Sartore to make portraits of the world's animals -- especially those that are endangered. His message: to know these animals is to save them. Sartore intends to photograph every animal in captivity in the world. He is circling the globe, visiting zoos and wildlife rescue centers to create studio portraits of 12,000 species, with an emphasis on those facing extinction. He has photographed more than 6,000 already and now, thanks to a multi-year partnership with National Geographic, he may reach his goal. This book showcases his animal portraits: from tiny to mammoth, from the Florida grasshopper sparrow to the greater one-horned rhinoceros. Paired with the prose of veteran wildlife writer Douglas Chadwick, this book presents an argument for saving all the species of our planet.

*Capybaras* Rexford D. Lord,2009-09 This natural history details information about the capybaras' anatomy, ecology, behavior, biology, conservation, management, and taxonomy. Capybaras are robust and agile, and reach the size of a small pig and weigh upward of 100 pounds at maturity. They range throughout South American tropical wetlands. Largely extirpated from their former haunts through agricultural practices and poaching, they have adapted well to human management and conservation efforts and are frequently raised on ranches as valued sources of both meat and leather. The herbivorous rodents play a vital role in the ecosystems of natural grasslands, wetlands, and gallery forests and are commonly

prey for caimans, anacondas, jaguars, and pumas. The book describes the capybaras' known history; the diseases, parasites, and hazards they face; and their population and behavioral characteristics. It also discusses how they interact with predators and other animals and explains their long-running and growing commercial importance to humankind.

**Bringing Back the Beaver** Derek Gow,2020 A bold new voice in nature writing, from the front lines of Britain's rewilding movement Bringing Back the Beaver is farmer-turned-ecologist Derek Gow's inspirational and often riotously funny firsthand account of how the movement to rewild the British landscape with beavers has become the single most dramatic and subversive nature conservation act of the modern era. Since the early 1990s - in the face of outright opposition from government, landowning elites and even some conservation professionals - Gow has imported, quarantined and assisted the reestablishment of beavers in waterways across England and Scotland. In addition to detailing the ups and downs of rewilding beavers, Bringing Back the Beaver makes a passionate case as to why the return of one of nature's great problem solvers will be critical as part of a sustainable fix for flooding and future drought, whilst ensuring the creation of essential lifescapes that enable the broadest possible spectrum of Britain's wildlife to thrive--

Arthropods Vonnie D.C. Shields,2023-11-08 This book provides contributions on various topics pertaining to arthropods (insects and non-insects) written by experts in their respective fields. It targets a wide audience of entomologists, biologists, ecologists, zoologists, teachers, and students. The book is divided into four main sections on “Development”, “Food Detection and Feeding Behavior”, “Vector-borne Diseases”, and “Structure and Function of Vision”. **Zoo Animal Welfare** Terry Maple, Bonnie M Perdue, 2013-03-22 Zoo Animal Welfare thoroughly reviews the scientific literature on the welfare of zoo and aquarium animals. Maple and Perdue draw from the senior author's 24 years of experience as a zoo executive and international leader in the field of zoo biology. The authors' academic training in the interdisciplinary field of psychobiology provides a unique perspective for evaluating the ethics, practices, and standards of modern zoos and aquariums. The book offers a blueprint for the implementation of welfare measures and an objective rationale for their widespread use. Recognizing the great potential of zoos, the authors have written an inspirational book to guide the strategic vision of superior, welfare-oriented institutions. The authors speak directly to caretakers working on the front lines of zoo management, and to the decision-makers responsible for elevating the priority of animal welfare in their respective zoo. In great detail, Maple and Perdue demonstrate how zoos and aquariums can be designed to achieve optimal standards of welfare and wellness.

Global Health Impacts of Vector-Borne Diseases National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Global Health, Forum on Microbial Threats, 2016-10-21 Pathogens transmitted among humans, animals, or plants by insects and arthropod vectors have been responsible for significant morbidity and mortality throughout recorded history. Such vector-borne diseases including malaria, dengue, yellow fever, and plague together accounted for more human disease and death in the 17th through early 20th centuries than all other causes combined. Over the past three decades, previously controlled vector-borne diseases have resurged or reemerged in new geographic locations, and several newly identified pathogens and vectors have triggered disease outbreaks in plants and animals,

including humans. Domestic and international capabilities to detect, identify, and effectively respond to vector-borne diseases are limited. Few vaccines have been developed against vector-borne pathogens. At the same time, drug resistance has developed in vector-borne pathogens while their vectors are increasingly resistant to insecticide controls. Furthermore, the ranks of scientists trained to conduct research in key fields including medical entomology, vector ecology, and tropical medicine have dwindled, threatening prospects for addressing vector-borne diseases now and in the future. In June 2007, as these circumstances became alarmingly apparent, the Forum on Microbial Threats hosted a workshop to explore the dynamic relationships among host, pathogen(s), vector(s), and ecosystems that characterize vector-borne diseases. Revisiting this topic in September 2014, the Forum organized a workshop to examine trends and patterns in the incidence and prevalence of vector-borne diseases in an increasingly interconnected and ecologically disturbed world, as well as recent developments to meet these dynamic threats. Participants examined the emergence and global movement of vector-borne diseases, research priorities for understanding their biology and ecology, and global preparedness for and progress toward their prevention, control, and mitigation. This report summarizes the presentations and discussions from the workshop.

Individual chapters focus on the consumption of horse meat, camel, buffalo, sheep, rabbit, wild boar, deer, goose, pheasant and exotic meats such as alligator, snake, frog and turtle. **Links Between Biodiversity Conservation, Livelihoods and Food Security** Sue Mainka, Mandar

Trivedi,2002 The global use of wild animals for meat is now the primary illegal activity in many protected areas, and growing human populations and a lack of livelihood options suggest that demand for wild meat is likely to continue to rise. This Occasional Paper contains the background information presented to participants at a workshop jointly organized by IUCN, FAO and TRAFFIC in Yaoundé, Cameroon. The workshop aimed to forge functional links among the various stakeholders concerned with the unsustainable use of wild fauna for food, and it contains the communiqué and a summary of the discussions related to problems and solutions.
